

Welcome to TBMT42: Systems Biology, Digital Twins, and AI

Gunnar Cedersund,
Biomedical Engineering (IMT)

Overview of this lecture

Each now block
in the lecture is
marked with a
cloud

- Overview introduction to the three concepts: systems biology, digital twins, and AI (and their interrelations)
- Practical elements and overall structure of the course
- Examinations
- A little bit of inspiration of what this can be used for
- Pedagogical goals and principles

EU AI Act: first regulation on artificial intelligence

Society Updated: 14-06-2023 - 14:06
Created: 08-06-2023 - 11:40

The use of artificial intelligence in the EU will be regulated by the AI Act, the world's first comprehensive AI law. Find out how it will protect you.

AI is all over
the news
nowadays

Digital twins is used in industry since a long time, and is now returning to biology

Overview of our digital twins

Immunology and the X-HiDE consortium

A realistic brain and face – Catalyst project

Cellular processes in fat and liver tissue

Exercise, yoga and biomechanics

Blood flow and blood pressure, based on advanced MRI

Systems biology is the art of integrating pieces of knowledge into useful models

Mechanistic insights
(systems biology)

faster
➔

Making a difference
(companies, eHealth)

The limitation of only using AI and machine learning: the three generations of eHealth

eHealth 1.0: present data

Clinical data

User data

No mechanistic understanding used or gained

Show data & communicate with others (no analysis of data)

eHealth 2.0: narrow AI & ML

Large clinical studies

Omics

Images

Hard to general understand

Risks, features, & classifications

Generated images

eHealth 3.0: hybrid M⁴ & digital twins

All types of data, including new data not originally intended

Simulation of user-defined scenarios: mechanistic insights & risks

Systems biology and AI: mechanistic modelling vs bioinformatics and machine learning

Simulated risk

Simulations & biomarkers

Hybrid digital twins

Modules & biomarkers

Mif

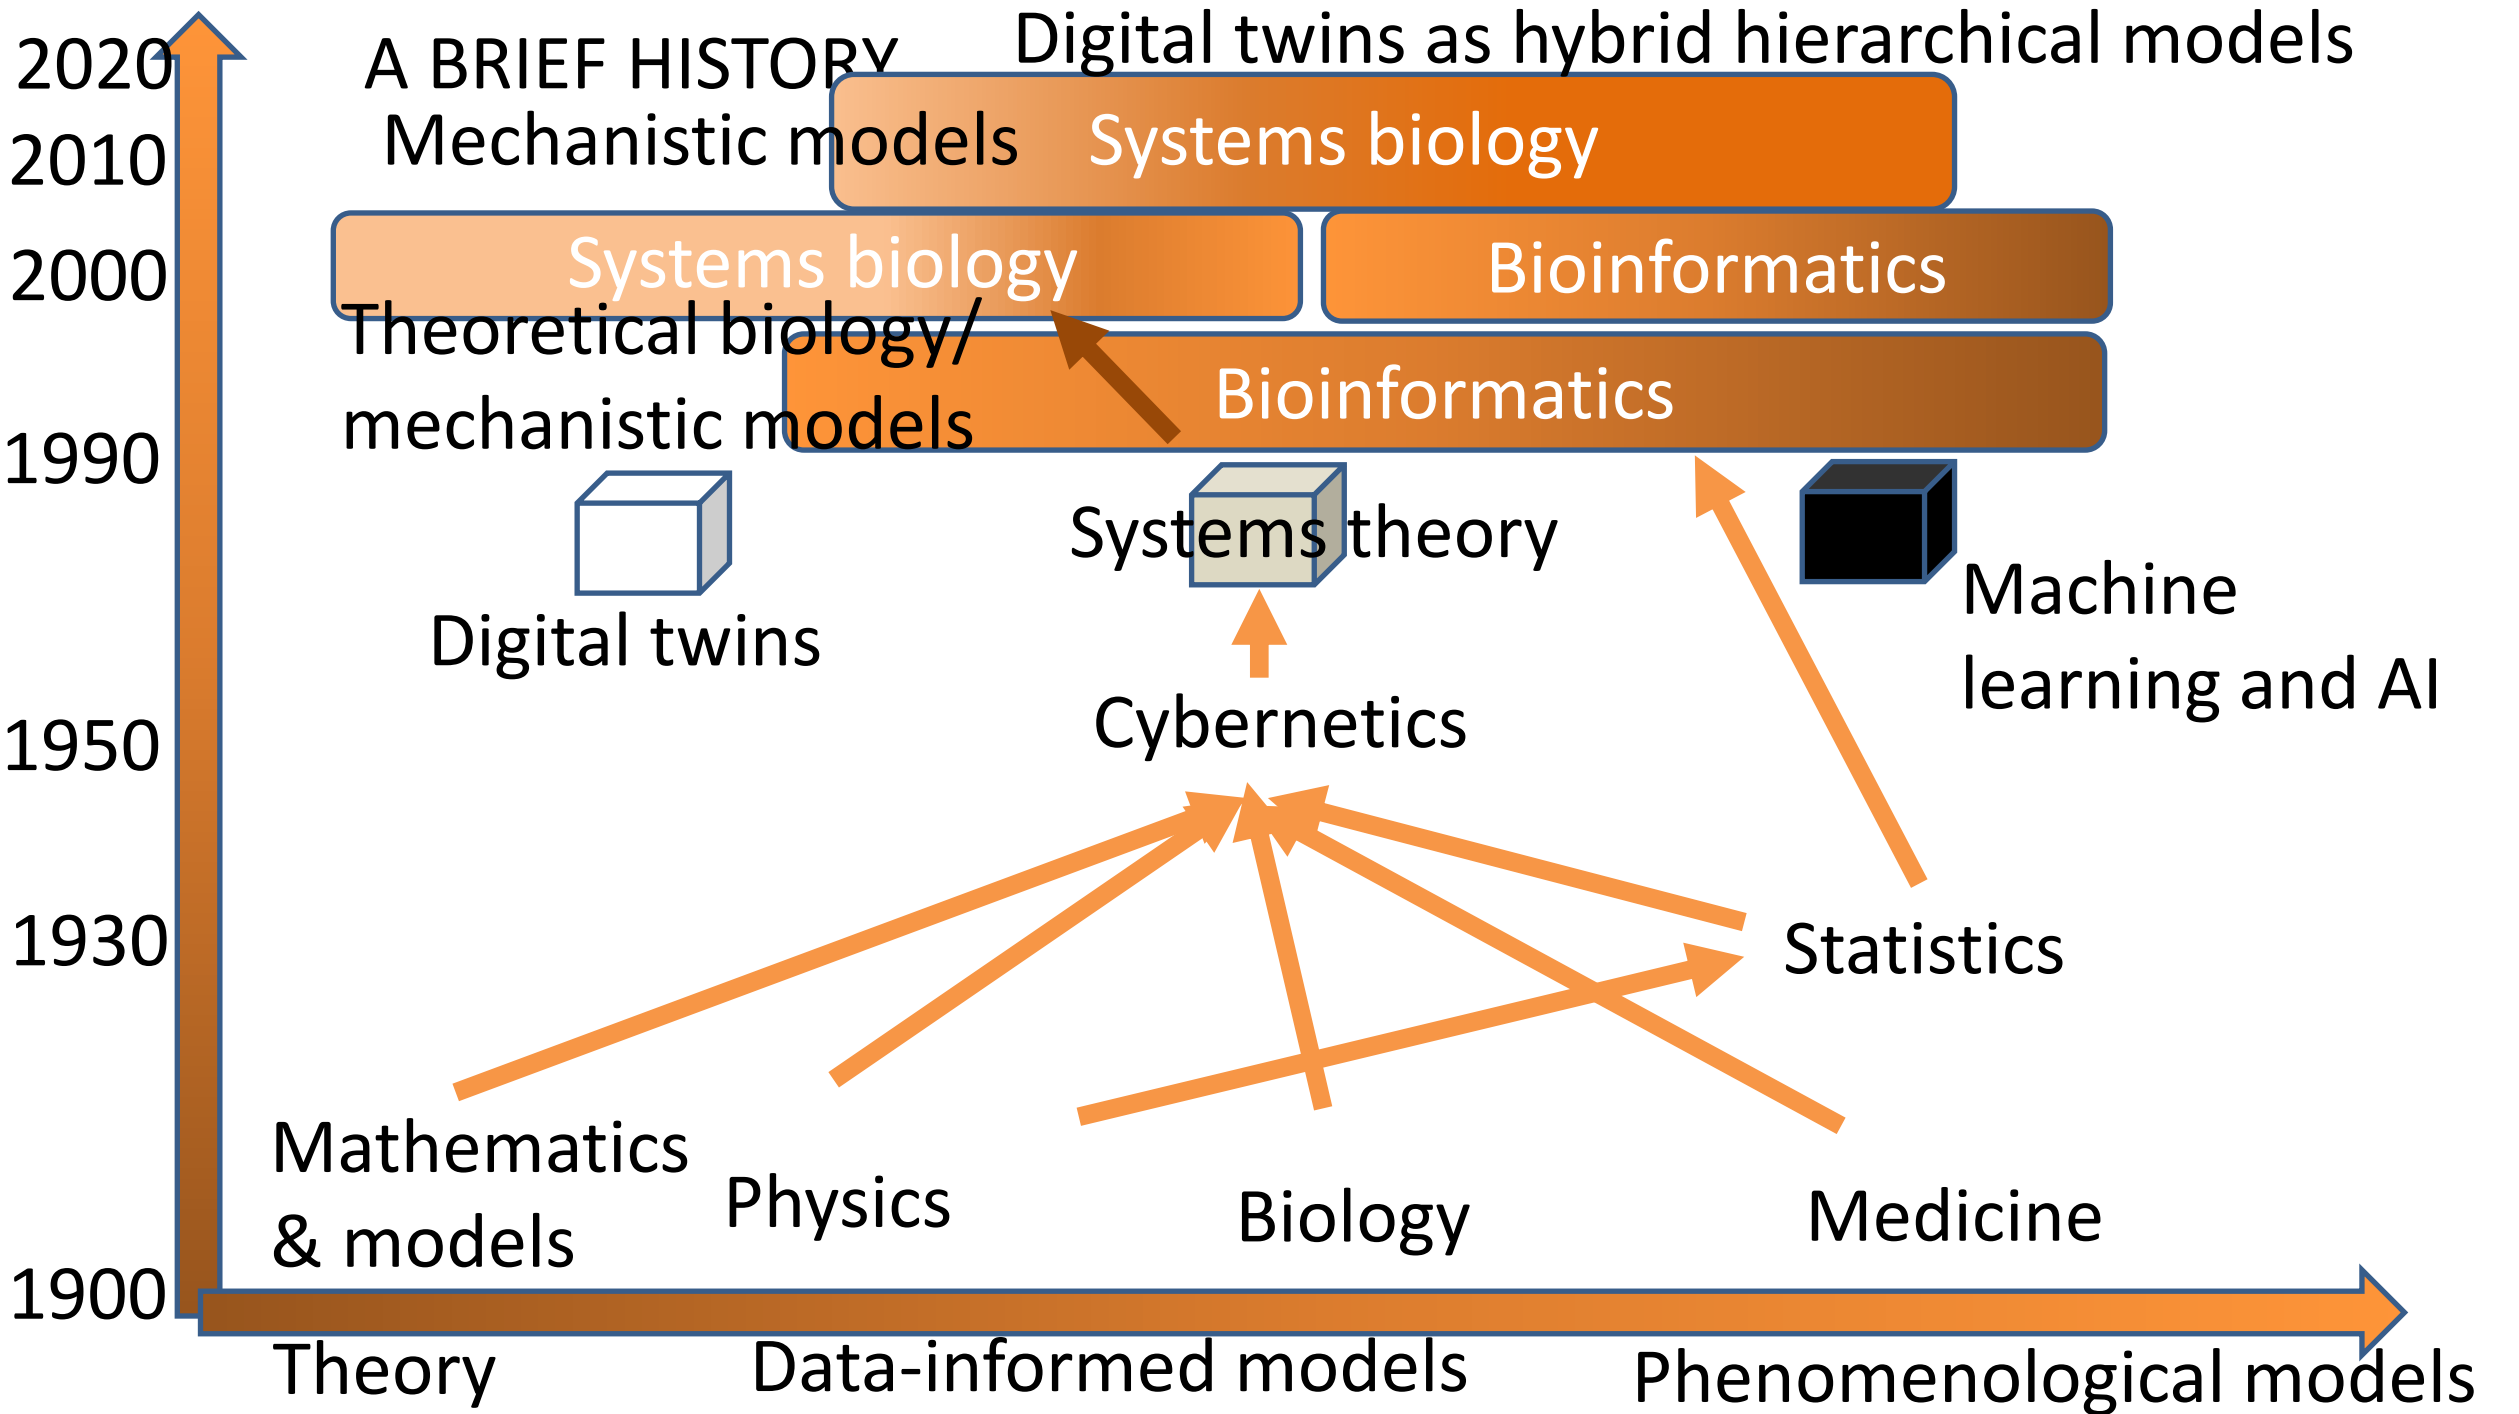

Mechanistic models

Automated modelling to omics-level

Bioinformatics network models

Top-level overview of course

Turning now to
the next part:
practicalities of
the course

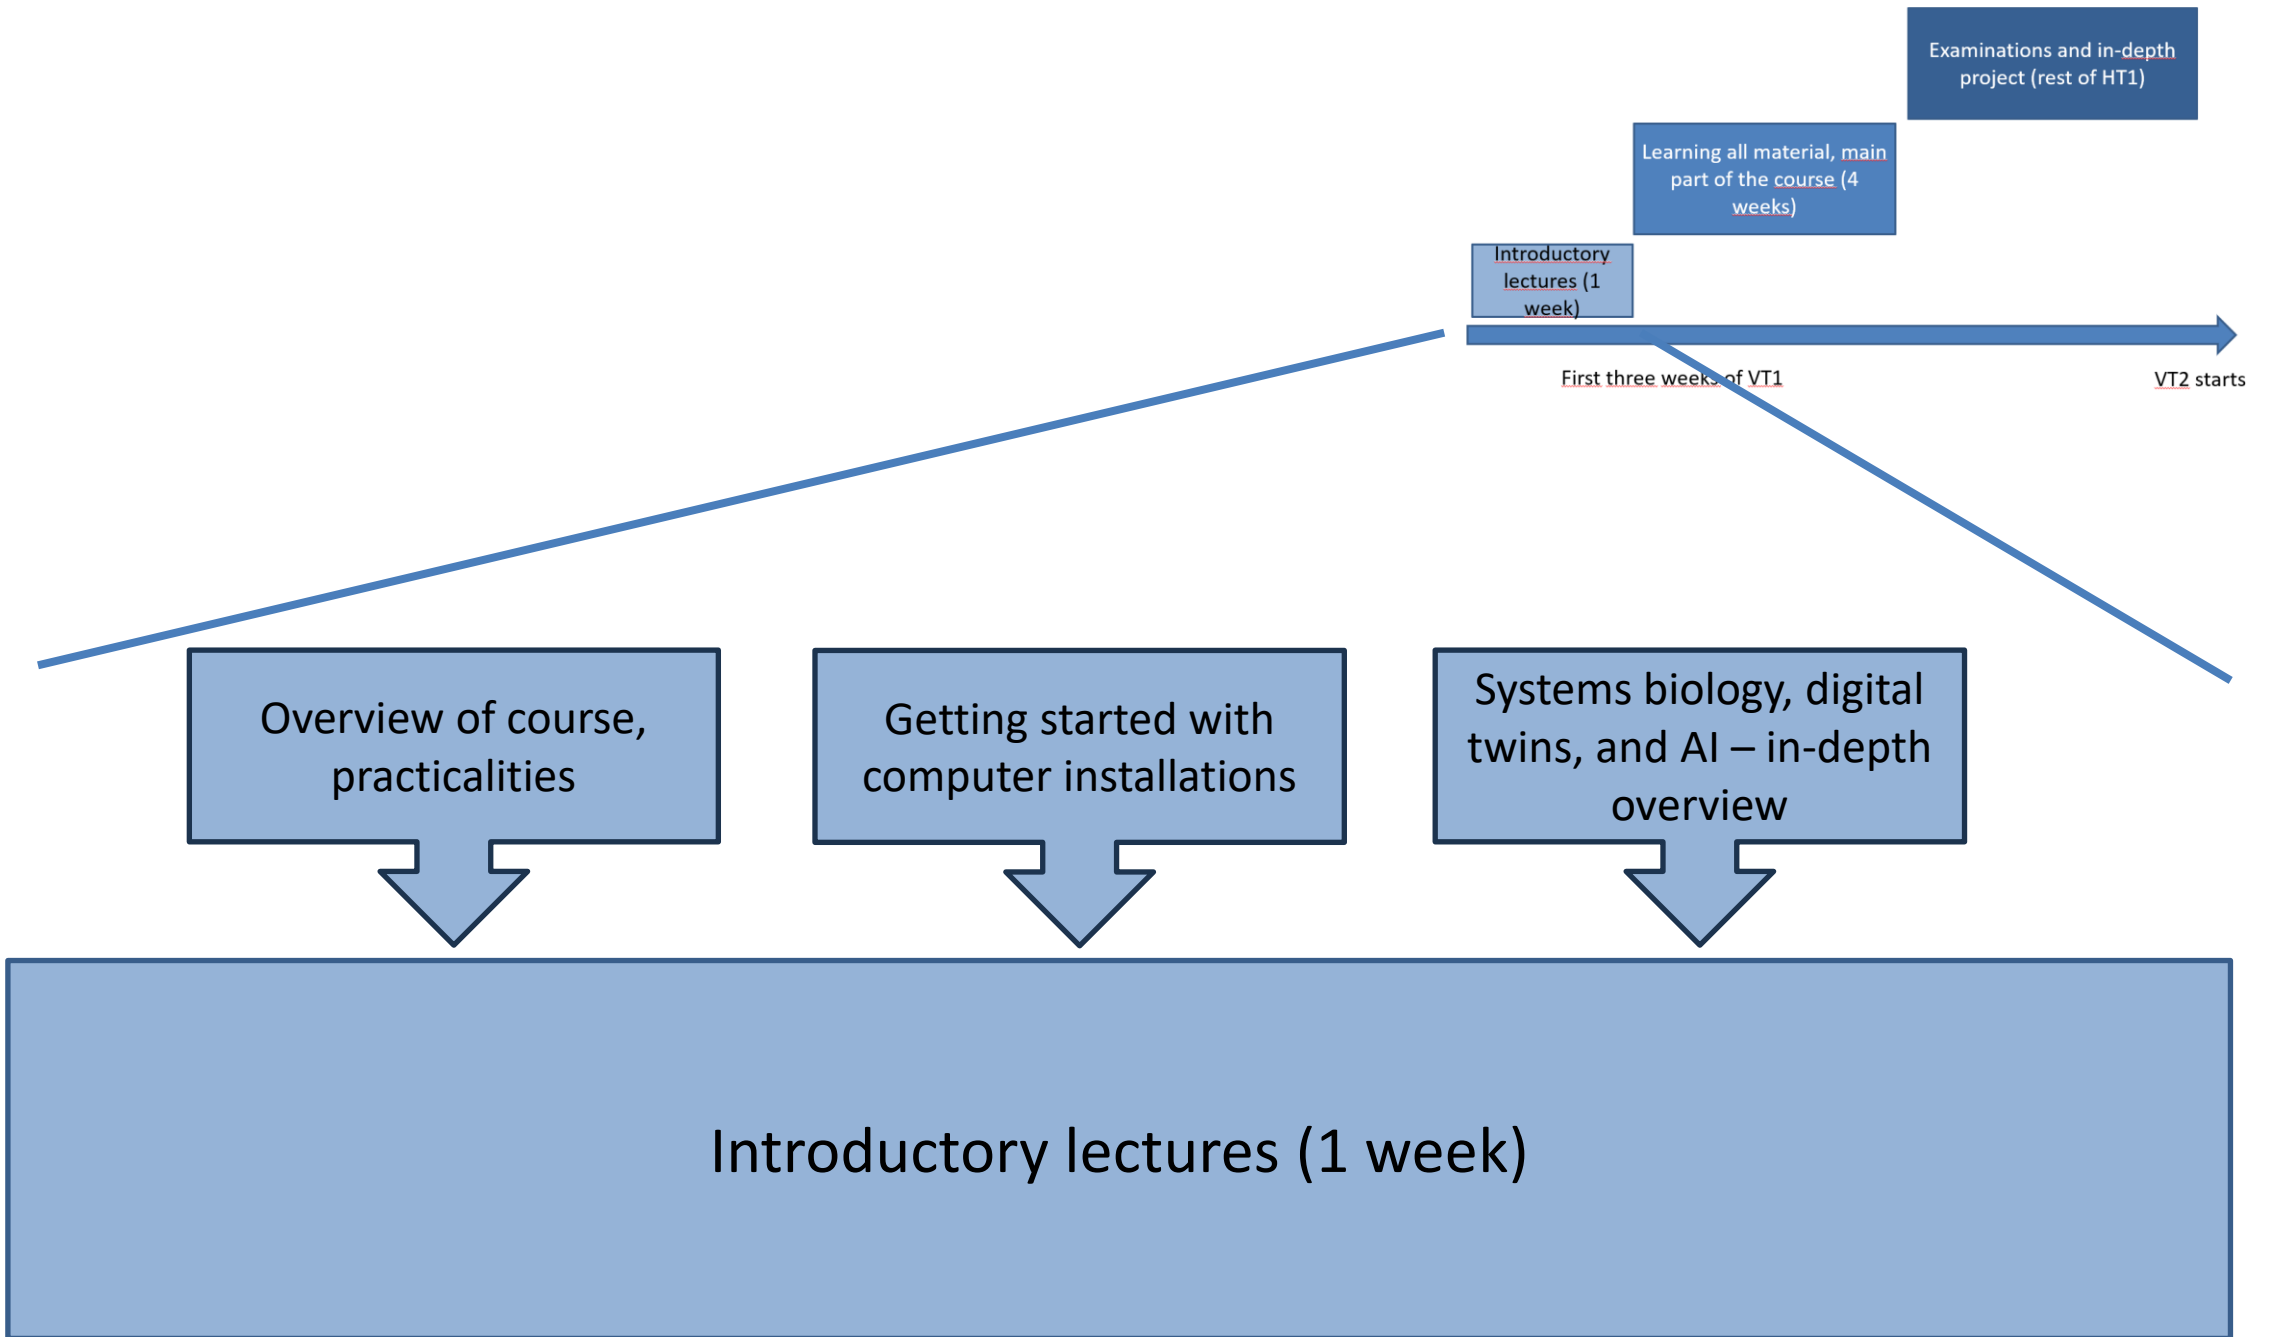

Examinations and in-depth
project (rest of HT1)

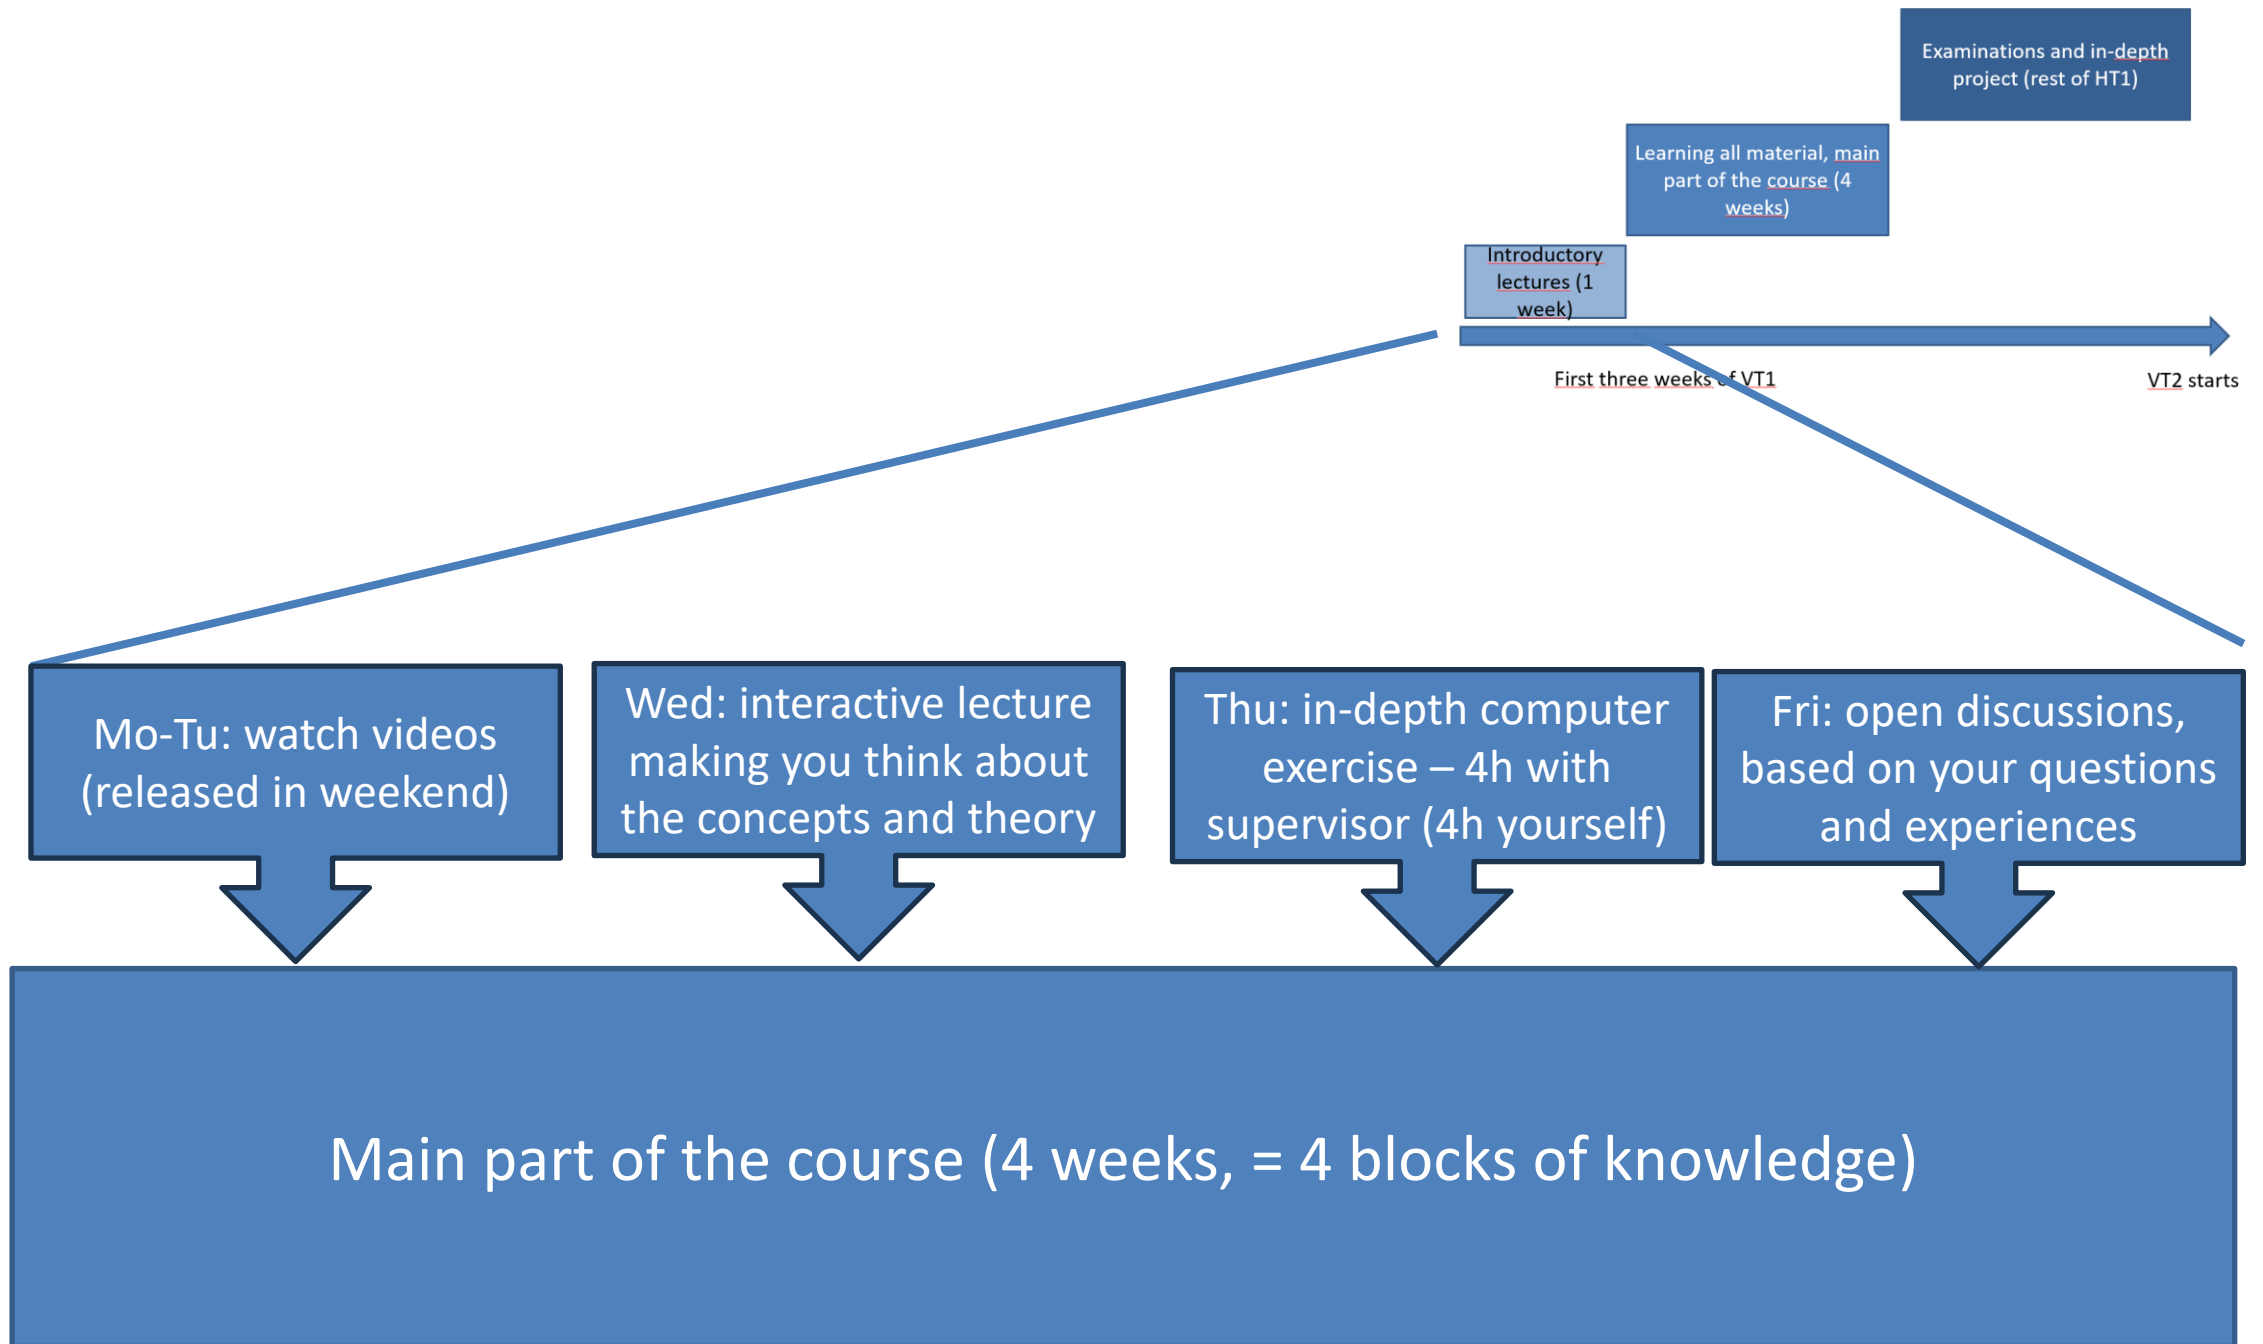

Learning all material, main
part of the course (4
weeks)

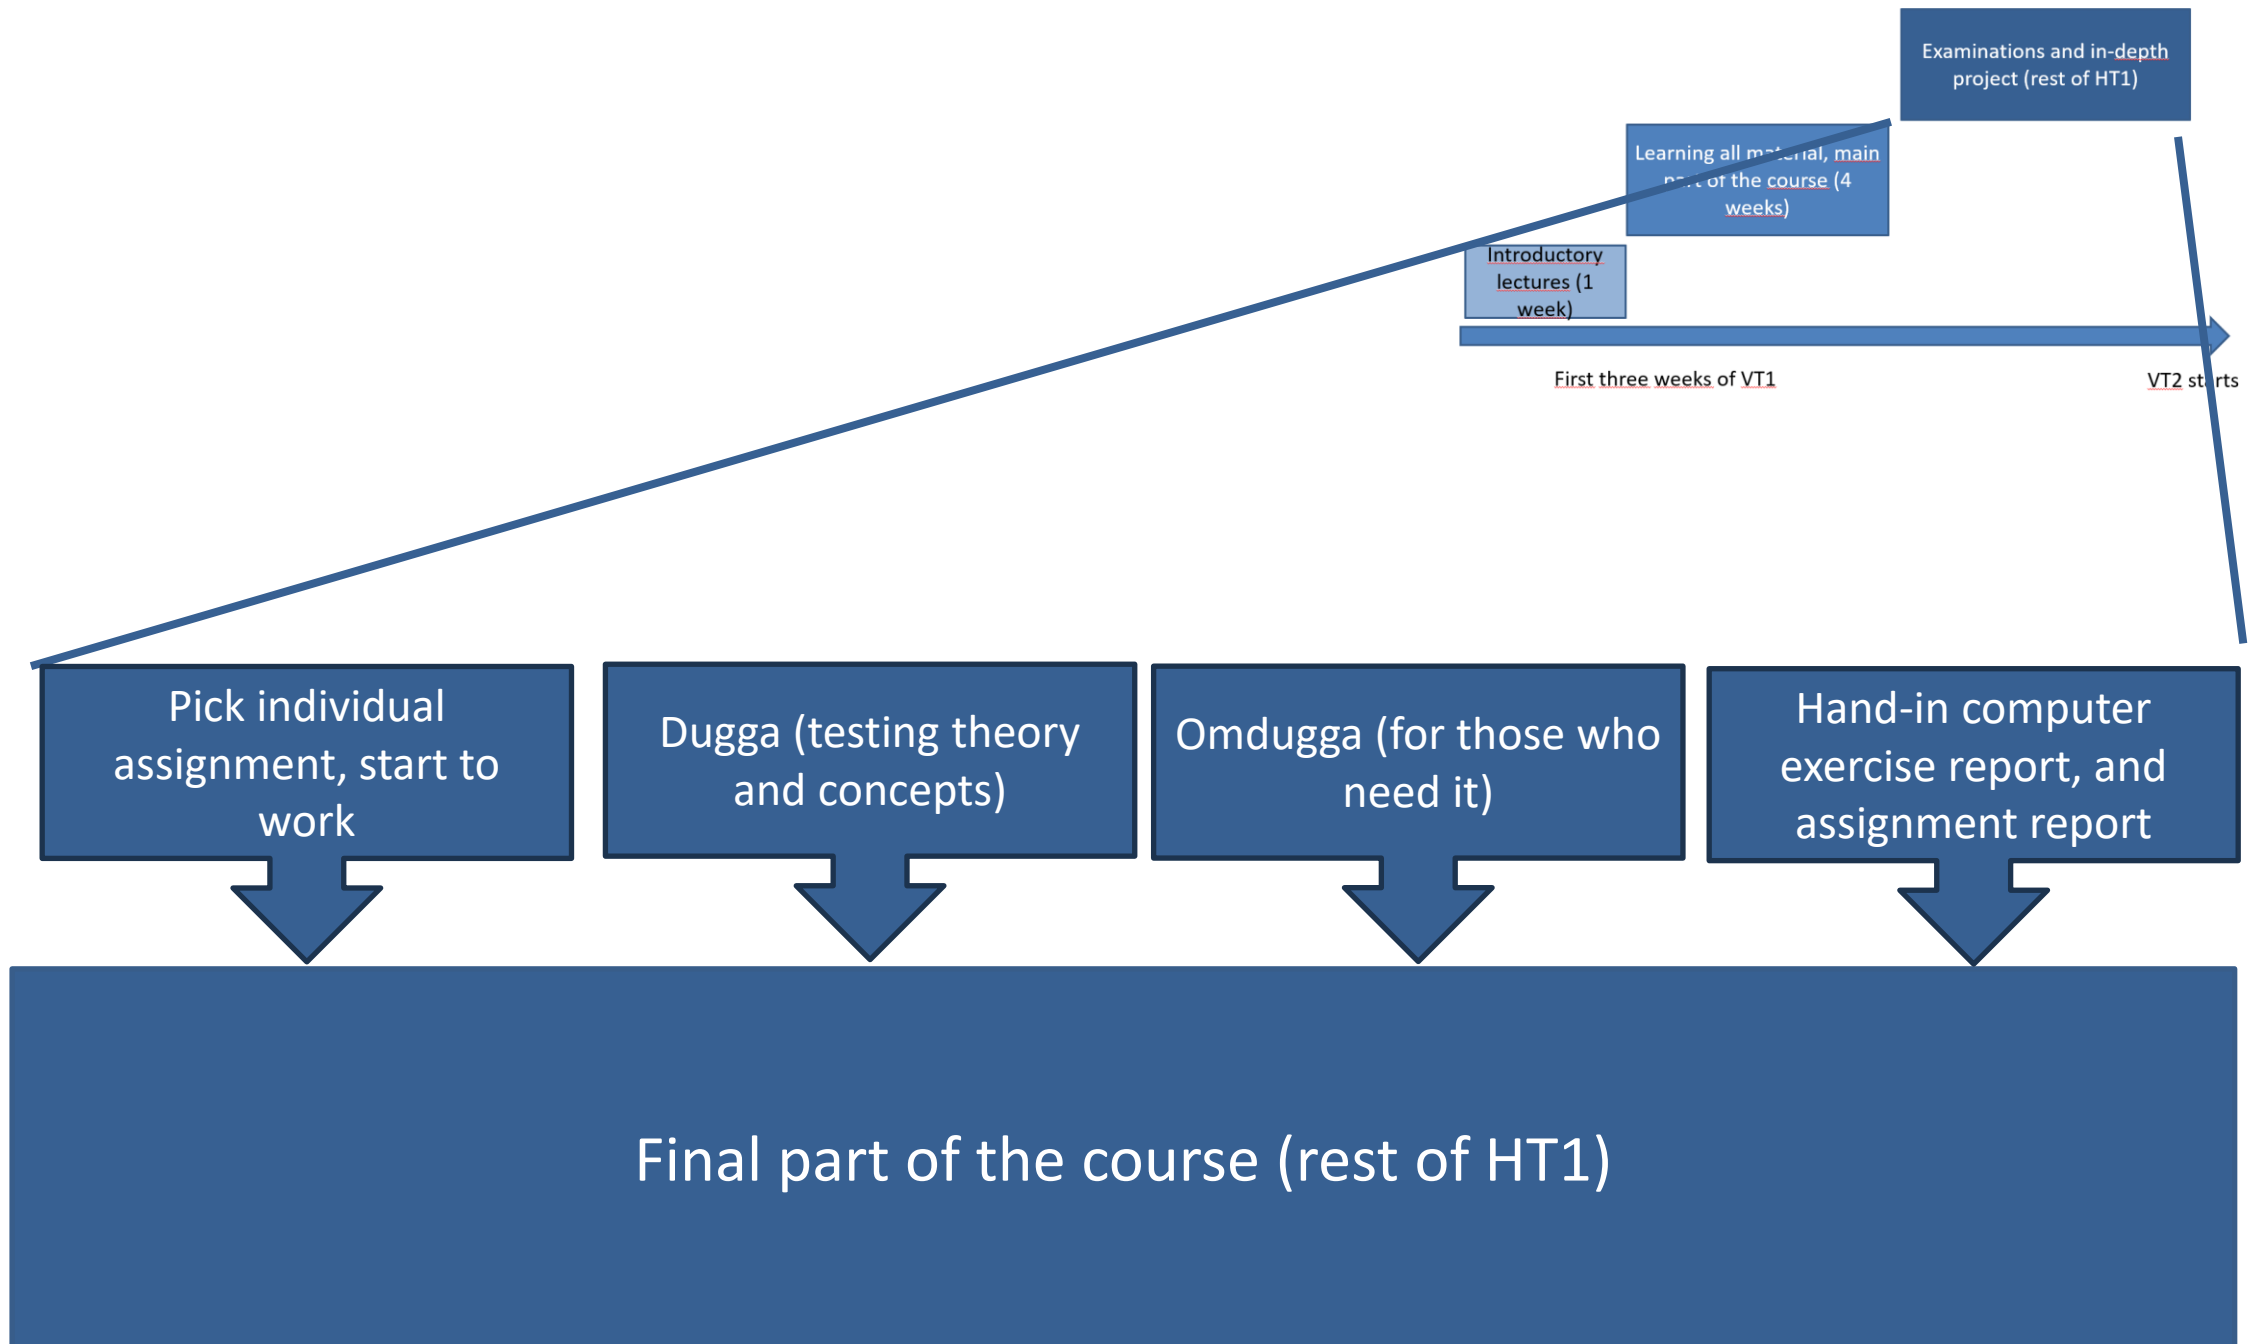

Introductory
lectures (1
week)

First three weeks of VT1

VT2 starts

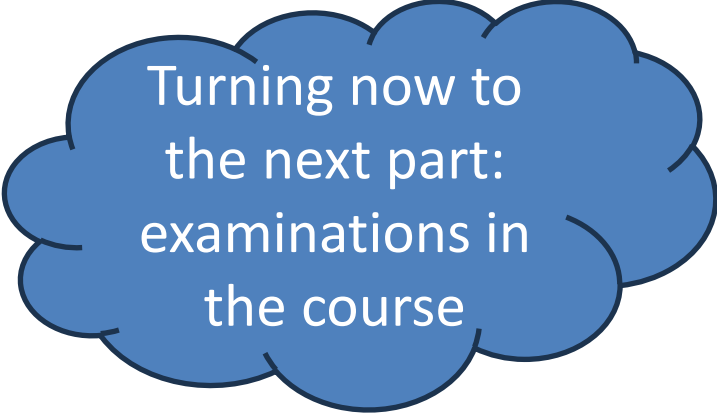

The four blocks of material

- Formalisms for model formulation and nonlinear dynamical systems
- Parameter estimation and model uncertainty
- Nonlinear mixed-effects modelling, and applications in drug development and personalized medicine
- Hybrid models, machine learning, and digital twins

Examinations

Turning now to
the next part:
examinations in
the course

- 1) *Dugga*** (mini-examination). 6 points per block, i.e 24 points in total. Passed req = 18/24 and at least 2 points in each block.
- 2) *Lab report***: one report for all labs. You should answer all questions in the end of the labs
- 3) *In-depth project***: oral presentation (ppt or similar), scripts, and abstract (~250 words)

Overview of systems biology, digital twins, AI and our research group

Returning to some inspiration

Sensors, Health Care Records, etc

All these are (former) TB* - students! **Blood flow and heart**, pressures, vol, heart rate

Casas 2017, 2018

Liver function, uptake, steatosis & NASH

Forsgren 2014, 2017, 2019

Brain neurovascular coupling

Lundengård 2016, Sten 2017, 2020

Fat tissue, glucose uptake, insulin resistance

Brännmark 2010, 2013,

Nyman 2014, 2016

Muscle metabolism *Cedersund 2006*

Beta cell, metabolism, oscillation and insulin secretion *Cedersund 2001, Palmér 2014*

Magnusson 2017, Nyman 2020

patient-specific data

MeDigiT Interface

useful personalized models
physiological AI

Digital Twin
(hybrid model)

Gunnar Cedersund, LiU

Immunology

From mechanistic knowledge to end-usage in 3 steps: 1) test sub-system 2) integrate 3) use

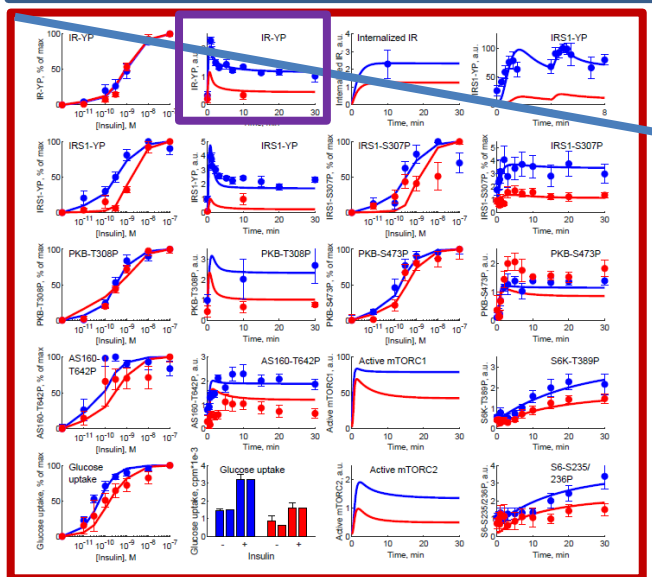

Mechanistic insights

Making a difference
(companies, eHealth)

The story of our original multi-level multi-timescale model

Data

Model

Approved by FDA

Brännmark 2010, JBC

Brännmark 2013, JBC

Nyman 2011, JBC

Hall, Lancet, 2011

Nyman and Herrgårdh, *in ms*

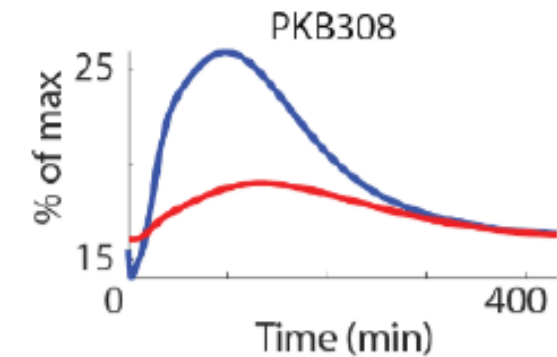

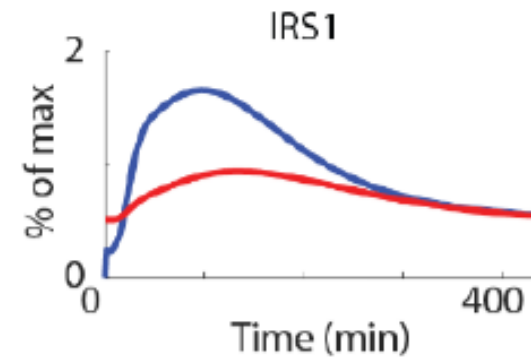

Application 3-4, health conversation and teaching

Scenario 1:

High calorie diet

+ 400 kcal/day

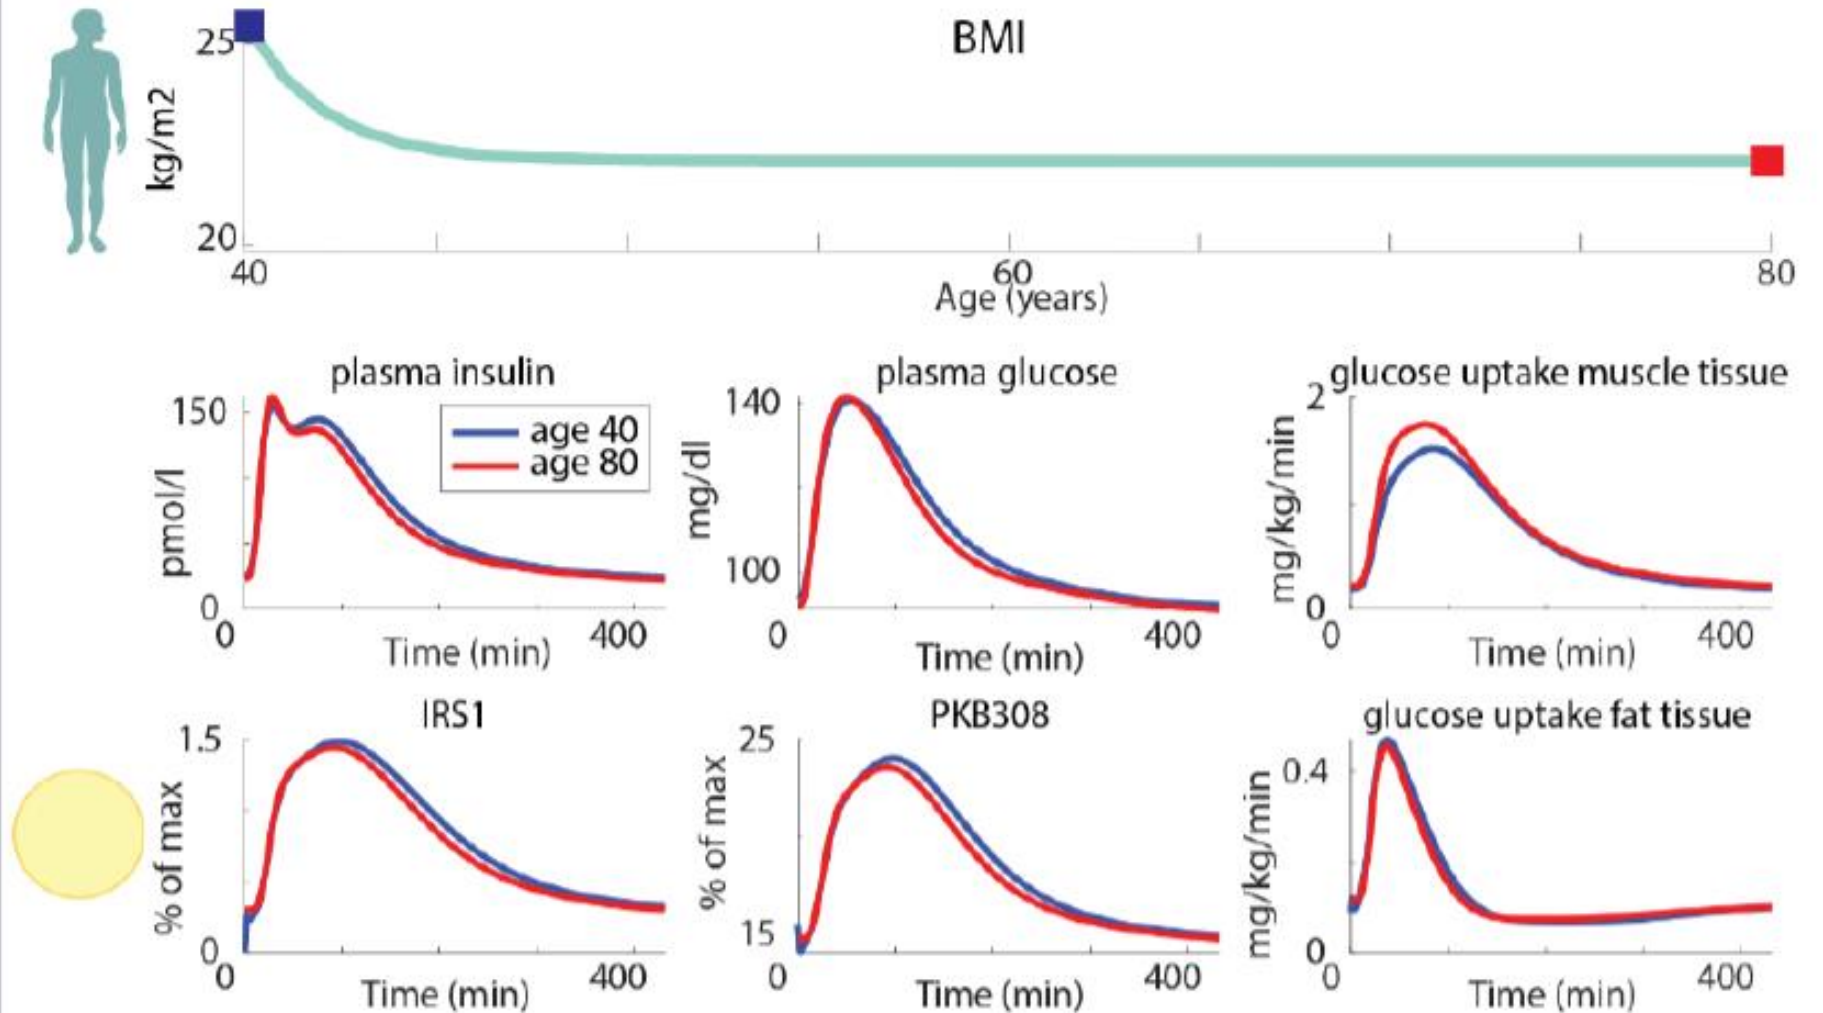

Application 3-4, health conversation and teaching

Scenario 2:

Low calorie diet
+ exercise

- 100 kcal/day

Comparison of corresponding risk between the two scenarios

Info

Here you find all info about the digital twin.

Digital twin attributes

Name: Gunnar
Age: 44.0
Height: 183.0
Diabetes: No
Weight: 82.0
Fat percentage (of total weight): 15.0
Sex: Man
Cigarettes per day: 0.0
Atrial fibrillation (before stroke): No
Systolic blood pressure: 145.0
Diastolic blood pressure: 110.0
Time of lowest cortisol levels (in minutes from midnight): 359.0
Time of highest cortisol levels (in minutes from midnight): 1380.0
Fasting glucose (mM): 5.5
Fasting insulin (pM): 150
Cholesterol levels (mg/dl): 178

Patient Avatars with Metahuman

- Free, easy to use tech for creating custom human avatars
- Accessable through browser, no need for powerful computer
- Add into Unreal Engine, comes fully rigged for animation

Face Scan Mesh to Metahuman

- Face scan -> Geometry -> Conversion -> Body Features

Your Metahuman in the app

- The patient customize their Metahumans, based on the face scan, to make it look like themselves
- We import it into the to application
- In the final application, patient can only access themselves, data is protected

Weight Adjustment

- Morph body to different weights
- Connected to simulations
 - Diet
 - Exercise
- Show progress over time on your body

Animations

- Play animations on the avatar
- Show yourself performing different motions
 - Work out
 - Rehab
 - Show potential progress if done correctly
- Goal is to record motion capture with medical professionals
 - Stroke rehab exercises

Transparent Mode

- Inspection mode, where you can look closer at organs
- Select organs to get information from back end simulations
- Interface to understand what happens in the body
 - Heart during exercise
 - Liver fat based on diet

Changing Context

- Allows for different environments
- Contextualize the data that you are looking at
 - Exercise at gym
 - Medical examination at the hospital

Pixel Streaming

- Pixel Streaming -> WebRTC -> browser or application
- Run avatar program on powerful computer, view and interact in browser or in your phone using a web connection

Digital twin benefits – different perspectives

Quick overview of status
Allows for digging deeper
Simulations of scenarios
Tailored treatments
Better communication
Use throughout your entire health journey

Better understanding of own health,
and *why* a specific diet is suggested
Integrate all their own data
In charge of their own care
Personalized advice from an eHealth coach that *follows you throughout life*

Big clinical studies:
UKBIOBANK, SCAPIS,
hospital databases, etc

Sociodemographics,
other risk factors

multi-omics, images

EHR, personal sensor data,
activity clocks, time-series

Mechanistic knowledge,
"regular papers"

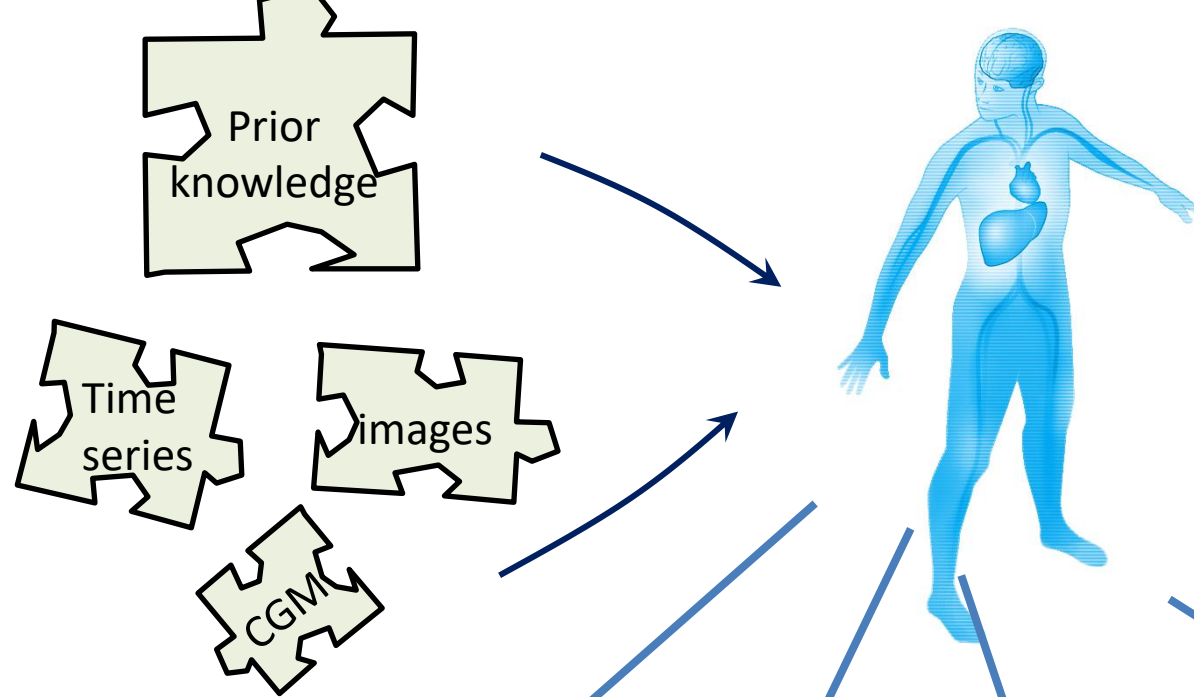

Translation from organs-on-a-chip and mice to humans using mathematical models

Bergqvist et al, JBC, 2017
 Simonsson et al, bioRxiv, 2021

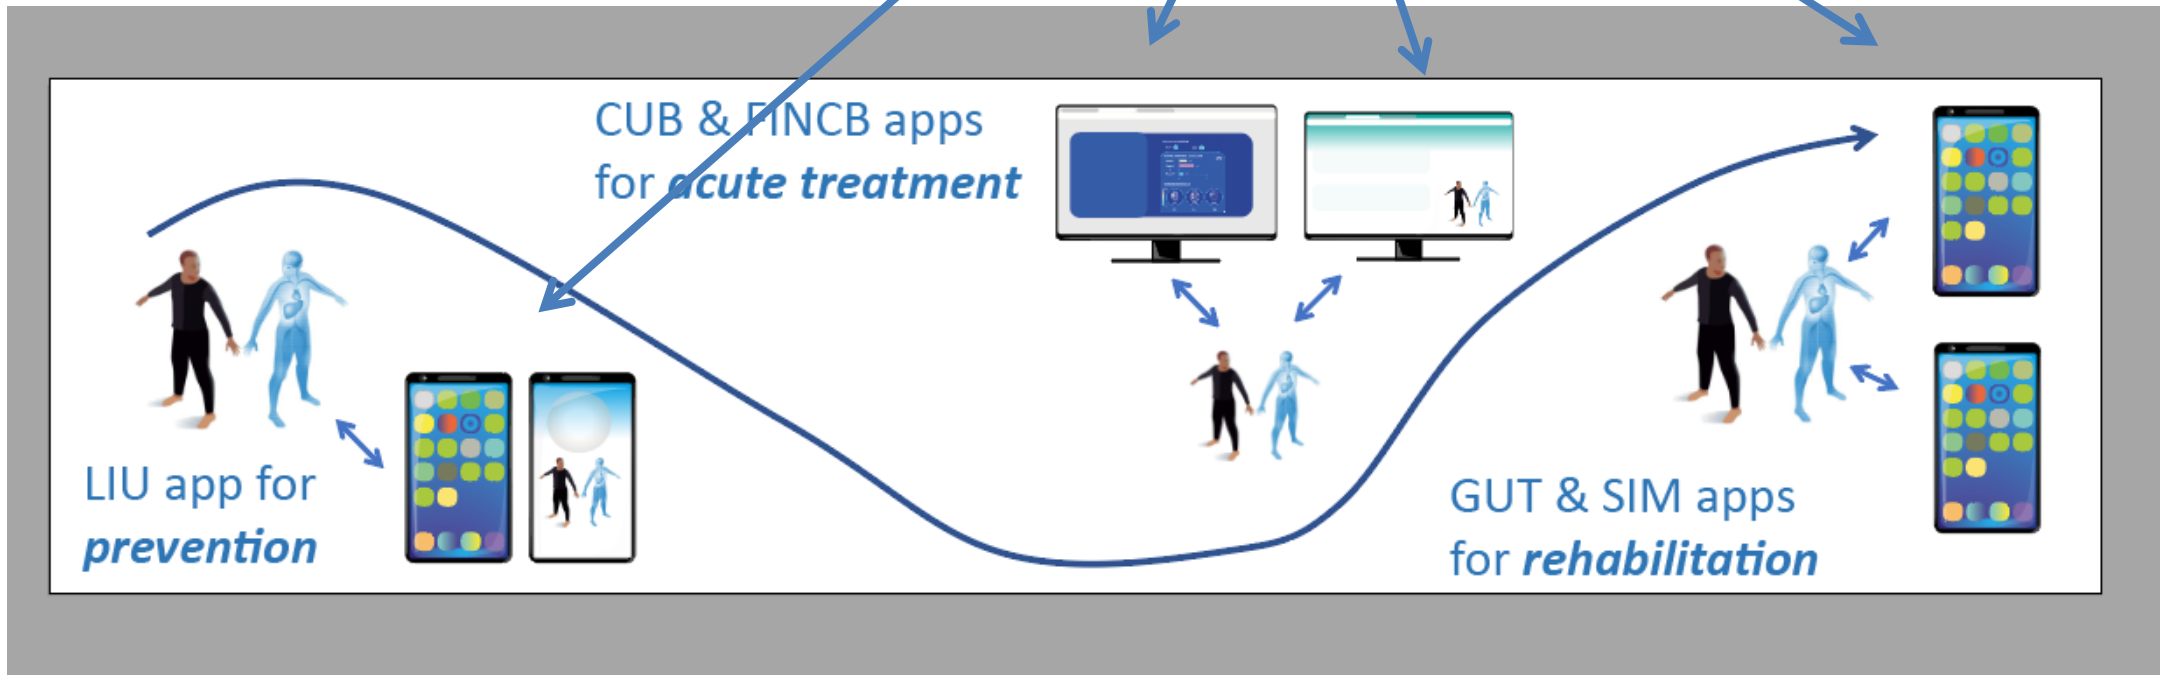

Bauer et al, Sci Rep, 2017
 Casas et al, bioRxiv, 2021

Up until now:

STRATIF-AI – a new 65 MSEK EU project coordinated by us

New vision:

Zurich-Milan Prognostic Calculator for Stroke Surgery, STRATIF-AI project

Male

Functional status at admission [Karnofsky Performance Status (KPS)]

10

neurosurgery.shinyapps.io/impairment/

Zurich-Milan Prognostic Calculator

Functional impairment after intracranial tumor surgery

Functional impairment at 3 to 6 months postoperatively

Predicted Probability

With surgery, there is a 9.1 % risk that new functional impairment will occur

Predicted Outcome

Based on the Zurich-Milan prognostic calculator, it is unlikely that new functional impairment will occur after surgery

Refresh the page to predict on a different patient

How was functional impairment defined?

We defined new postoperative functional impairment as a decrease of 10 points or greater on the Karnofsky Performance Scale (KPS) at 3 to 6 months postoperatively compared to the preoperative functional status.

Summary and long-term vision: a personalized patient-centered interconnected healthcare system

Experiments on your own cells in a little "mini-you"

Translation of results to your own digital twin

Addition of new data

Usage throughout your Patient Journey

Music, arts, gaming, teaching, etc

Performance from VPH
conference, September 2022

All your courses relate to the three pillars of systems biology

Finally something about the pedagogical concepts

Automatic control & programming
To analyse the data and model, and to draw the **correct conclusions**

Signal & Image analysis Matlab

Programming Mechanics

Bioinformatics

Biology & medicine
To understand the data, the question, and to read articles

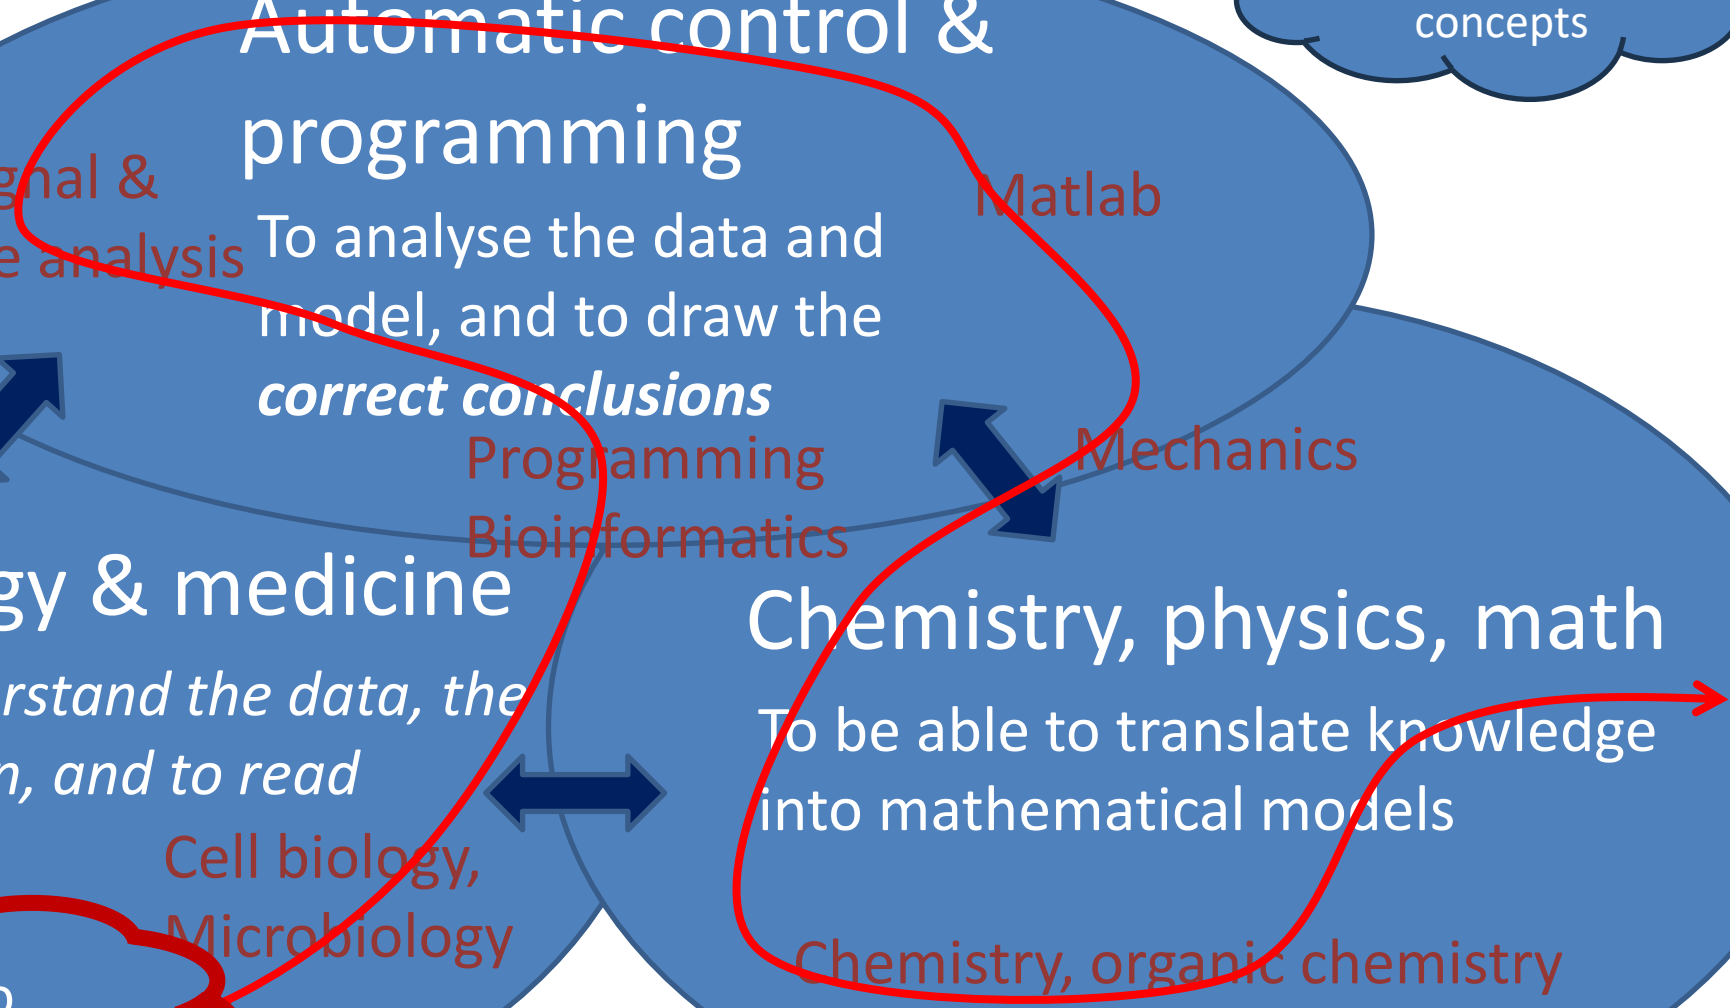

Molecular physics, Immune biology

Cell biology, Microbiology

Chemistry, physics, math
To be able to translate knowledge into mathematical models

Chemistry, organic chemistry
Linear algebra, calculus, etc

See Liftaren's guide to kandidaten:

”Liftarens guide till kandidaten”

Connected to a growing set of courses in semesters 1-5 (i.e. years 1-3), we are developing:

- Youtube videos
- exercises

which show the connection between that course and what TB¹-students at LiU² will do in their B.Sc. Project

You should be the first pilot students, if you started in 2020

However, anyone is welcome to use them, and you can contact Elin Nyman, who can give you access: elin.nyman@liu.se

The videos will also be added as a playlist to our youtube-channel

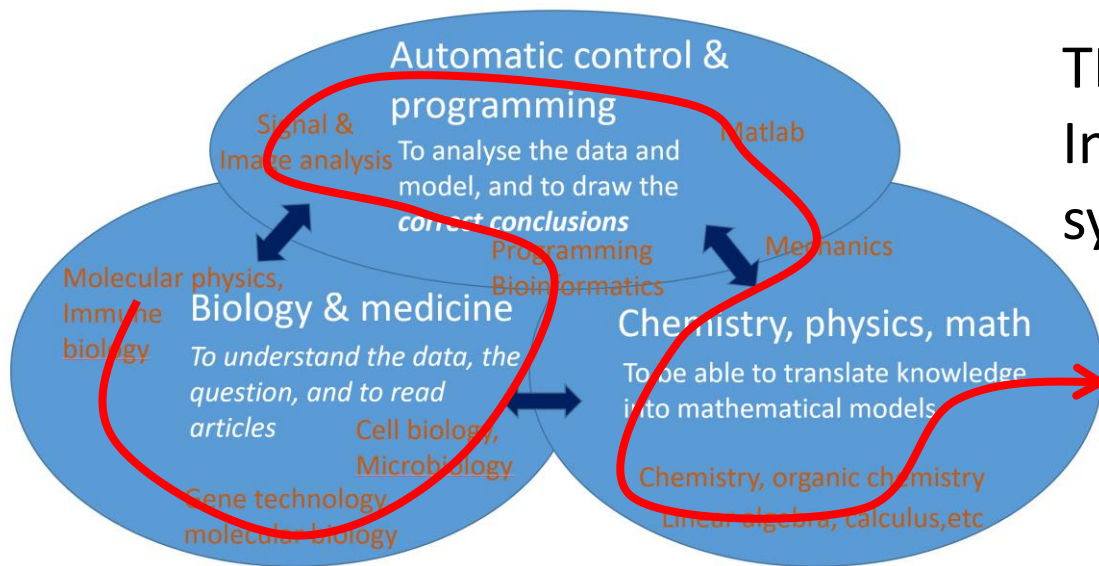

Zoomed-out view of all 5 years of TB

Building-blocks

First way of integrating skills
– first real project

Other ways of integrating skills –
more real projects, internships, etc

TBMT19 –
Introduction to
systems biology

Profile 1:
Sensor & biomaterials
eHealth sub-profile

eHealth "strimma"
